Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-14, drawn to methods of diagnosis by detecting a nucleic acid sequence, classified in class 435, subclass 6.
- II. Claims 15-17, drawn to nucleic acid sequences, classified in class 536, subclass 23.5.
- III. Claim 18, drawn to a polypeptide, classified in Class 530, subclass 350.
- Claims 19-27, drawn to a method of diagnosis by detecting a protein sequence, IV. classified in Class 435, subclass 7.1.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are related as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that product (M.P.E.P. § 806.05(h)). In the instant case, the nucleic acids of invention II can be used in a materially different process, such as for synthesizing nucleic acids or proteins, or for therapeutic methods.

Inventions I and III are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case, the different inventions are not disclosed as capable of use together because the proteins of invention III are not required to practice the method of invention I.

Art Unit: 1634

Inventions I and IV are drawn to patentably distinct inventions. Each invention is drawn to a distinct method which involves the use of different reagents and involves performing different method steps. In particular, invention I requires the use of nucleic acid probes or primers and performing nucleic acid hybridization, amplification or sequencing steps in order to detect the presence of a nucleic acid as diagnostic of a neuropsychiatric disorder.

Invention IV requires the use of a protein and requires performing ligand binding or protein sequencing methods in order to accomplish the objective of detecting a protein as diagnostic of a neuropsychiatric disorder.

Inventions II and III are patentably distinct in structure and physicochemical properties. Invention II is drawn to nucleic acids whereas invention III is drawn to proteins. Because nucleic acids are composed of nucleotides and proteins are composed of amino acids, the inventions have different structural and functional properties. Furthermore, the products are utilized in different methodologies, such that nucleic acids may be utilized in hybridization assays, while proteins may be utilized in ligand binding assays or to generate antibodies. Synthesis of the proteins of invention III do not require the particular products of the nucleic acids of invention II since the proteins of invention III can be isolated from natural sources or chemically synthesized.

Inventions II and IV are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case, the nucleic acids of invention II are not required to practice the method of invention IV.

Application/Control Number: 10/054,678

Art Unit: 1634

Inventions III and IV are related as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that product (M.P.E.P. § 806.05(h)). In the instant case, the proteins of invention III can be used in a materially different process, such as for generating antibodies or for therapeutic methods.

Because these inventions are distinct for the reasons given above and have acquired a different status in the art as demonstrated by their different classification and recognized divergent subject matter and because inventions I-IV require different searches that are not coextensive, examination of these distinct inventions would pose a serious burden on the examiner and therefore restriction for examination purposes as indicated is proper.

A telephone call was made to Lisa Treannie on July 16, 2003 to request an oral election to the above restriction requirement, but did not result in an election being made because Applicants requested that the restriction be made in writing.

Applicant is advised that the response to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed.

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 C.F.R. § 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a diligently-filed petition under 37 C.F.R. § 1.48(b) and by the fee required under 37 C.F.R. § 1.17(h).

Application/Control Number: 10/054,678

Art Unit: 1634

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Carla Myers whose telephone number is (703) 308-2199. The examiner can normally be reached on Monday-Thursday from 6:30 AM-5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Benzion, can be reached on (703)-308-1119. Papers related to this application may be faxed to Group 1634 via the PTO Fax Center using the fax number (703)-872-9306 or (703)-872-9307 (after final).

Any inquiry of a general nature or relating to the status of this application should be directed to the receptionist whose telephone number is (703) 308-0196.

Carla Myers July 21, 2003
